

Enterprise Knowledge Base Support Bot

Project Report & Submission Document

1. Introduction

The Enterprise Knowledge Base Support Bot is an AI-powered chatbot designed to answer employee questions using information stored in an enterprise knowledge base. The project demonstrates a simple Retrieval-Augmented Generation (RAG) workflow.

2. Project Objective

The objective is to build an AI support assistant that retrieves relevant information from company documents and generates clear responses to employee questions.

3. Tools and Technologies

Technology	Purpose
Dify AI	Build and manage the AI Chatflow
Knowledge Base	Store and retrieve enterprise information
RAG	Retrieve relevant information before generating an answer
LLM	Generate natural-language responses
PDF Document	Provide the enterprise knowledge source

4. Knowledge Base

A fictional enterprise named ABC Technologies Ltd. was used for demonstration. The knowledge base contains company overview, office hours, leave policy, attendance policy, work-from-home policy, salary and benefits, IT support, office rules, HR contacts, and FAQs.

5. System Workflow

User Input → Knowledge Retrieval → LLM → Answer

The user submits a question. Knowledge Retrieval searches the enterprise knowledge base. The retrieved context is passed to the language model, which generates the response. The final response is displayed through the Answer node.

6. Key Features

- Natural-language employee question answering
- Knowledge-base-based retrieval
- RAG-based response generation
- Professional AI responses
- Fallback behavior when information is unavailable

7. Example Questions

1. What are the office hours?
2. How many annual leave days are available?
3. Can employees work from home?
4. How can I contact IT Support?
5. What are the HR office hours?

8. Testing

The Chatflow was tested using the Dify Preview environment. The User Input, Knowledge Retrieval, LLM, and Answer nodes executed successfully during testing.

9. Conclusion

The project demonstrates a basic Enterprise Knowledge Base Support Bot using Dify and a RAG-based workflow, providing a simple way for employees to obtain information from centralized company documents.

10. Future Improvements

Future versions can include authentication, multiple documents, conversation history, multilingual support, feedback collection, analytics, and integration with Slack, Microsoft Teams, Google Drive, or HR systems.

Project Submission Note

ABC Technologies Ltd. and its policies are fictional and used only for educational project purposes.
